Mehmet Guzel

Backend Developer & DevOps Engineer

guzell.mehhmet@gmail.com +90 505 540 0944 İstanbul https://mehmettguzell.github.io/ github linkedin

Summary

Backend developer growing into DevOps and cloud. I've built microservice projects with Java (Spring) and Python, and I deploy them to the cloud through CI/CD pipelines I set up myself. During my internships, I worked closely on the development and deployment processes of production systems and contributed to them. In my personal projects, I'm gaining hands-on experience with Terraform and Ansible (Infrastructure as Code), Docker, AWS, Kubernetes and OpenShift, and I build web and mobile apps with React and React Native.

Experience

Backend Developer Intern Aug 2026 – Sep 2026

Codexist Ataşehir/İstanbul

Took an application from development to production end to end. Designed its scalable architecture, set up CI/CD pipelines with GitHub Actions, and managed its deployment to AWS using Terraform and Docker.

- Researched GEO (Generative Engine Optimization) and designed the project's architecture. The project measures how visible a company is in LLM answers compared to its competitors, with a margin of error, then reports the results and generates recommendations.
- Built a pipeline with data collection, analysis, calculation and reporting stages. Collected data from multiple LLM providers and ran the daily scanning and analysis jobs asynchronously. Built the frontend with TypeScript and React.
- Defined the AWS infrastructure in Terraform, including the number of EC2 instances and scheduled scaling. Automated server setup with Ansible and packaged the application with Docker Compose.
- Set up a GitHub Actions pipeline that runs lint and unit tests on every push and PR. When changes are merged into main, the image is built, pushed to ECR and deployed to EC2 automatically

Cyber Security Intern Jul 2023 – Jul 2024

Privia Security Ataşehir/İstanbul

- Analyzed live web applications at the code and API level as part of penetration tests, and identified and reported security vulnerabilities.
- Built tools that automate recurring security checks and improve the team's technical workflows.
- Worked with development teams to fix the identified vulnerabilities and suggested code-level solutions.

Projects

STOP

- Stop is a mobile app I built for organizing pickup football matches. I developed the backend with Java Spring and split it into five services: Gateway, Identity, Match, Communication and Notification. Each service has its own PostgreSQL database, with its schema managed by Flyway.
- The services mostly communicate through Kafka events (20+ topics), and notifications are generated from these events.
- I built features such as match join requests, invitations, a waitlist that automatically brings in the next player when a spot opens up, match chat with WebSocket/STOMP, and calling a goalkeeper.
- I added JWT authentication to the services. With rate limiting and circuit breakers, I made sure the system keeps running under heavy traffic and when failures occur.
- I set up a CI/CD pipeline that automatically builds the services and deploys them to AWS when a tag is pushed. If a deployment fails, the system automatically rolls back to the previous version.

Tempo: Calendar, Tasks & Budget App

- A personal productivity app that brings calendar, task, project and budget management together in one place, available on both mobile and desktop. Still in development.
- I developed the backend with Java 25 and Spring Boot using a modular structure. I used Keycloak for authentication and Server-Sent Events for syncing data across devices. The database is PostgreSQL, with its schema managed by Flyway.
- The app is local-first. Data is stored on the device, the app works without an internet connection, and data syncs with other devices once the connection is back.
- I packaged the backend with a multi-stage Docker build. I set up a CI/CD pipeline that runs the tests and automatically builds the desktop version on every change. If a new version passes the tests, it is automatically deployed to a VPS I rented.

Education

Software Engineer (English) — İstanbul • Sep 2021 – Jun 2026

Maltepe University — 3,11/4

Languages

English

B2

Skills

Devops

- Kubernetes
- Docker
- GHCR
- Linux (Ubuntu)
- Terraform
- Ansible
- AWS
- Bash, Python
- Jenkins
- GitOps
- OpenShift

Java

- Java Spring
- REST API
- Git
- PostgreSQL 9
- Kafka, RabbitMQ
- Redis
- Unit ve integration test
- Mikroservis
